RING THEORY

Level Three

Asst. Lecturer. Hadil Hazim Sami

LECTURE NO. 5

Corollary: suppose that R be a ring with identity 1 and has no zero divisors then $a^2 = a \rightarrow a = 0$ or $a = 1$

Proof: $a^2 = a$

$$\rightarrow a^2 - a = 0$$

$$a(a - 1) = 0 \text{ [since } R \text{ has no zero divisors]}$$

$$\rightarrow a = 0 \text{ or } a - 1 = 0$$

$$\rightarrow a = 1$$

$$\therefore a = 0 \quad \text{or} \quad a = 1.$$

Definition: An integral domain is a comm. ring with identity without zero divisor.

Example1: $(\mathbb{Z}, +, \cdot)$, $(\mathbb{R}, +, \cdot)$, $(\mathbb{Q}, +, \cdot)$, $(\mathbb{C}, +, \cdot)$ are integral domain.

Example2: $(\mathbb{Z}_n, +_n, \cdot_n)$

If $n = \text{prime} \quad \Rightarrow \quad \text{ID}$

If $n = \text{Not prime} \quad \Rightarrow \quad \text{not ID}$

H.W. Is $(\mathbb{Z}_e, +_e, \cdot_e)$ an integral domain?

Subring

Definition1: let $(R, +, \cdot)$ be a ring, let $\emptyset \neq S \subseteq R$ then S is called a subring of R iff $(S, +, \cdot)$ is a ring.

Definition2: Let $(R, +, \cdot)$ be a ring and let $\emptyset \neq S \subseteq R$ then $(S, +, \cdot)$ is a subring of $(R, +, \cdot)$ iff:

- 1) $a - b \in S \quad \forall a, b \in S.$
- 2) $a \cdot b \in S \quad \forall a, b \in S.$

Note: Every ring $(R, *, \circ)$ has two trivial subring $(\{e\}, *, \circ)$ and $(R, *, \circ).$

Example: In the ring of integers $(Z, +, \cdot)$ the triple $(Ze, +, \cdot)$ is a subring of $Z.$ while $(Zo, +, \cdot)$ is not subring of $Z.$ a

Q/ Let $S = \{a + b\sqrt{3} : a, b \in \mathbb{Z}\}$ show that $(S, +, \cdot)$ subring of $(\mathbb{R}, +, \cdot)$.

Sol/ Let $a_1 + b_1\sqrt{3}$, $a_2 + b_2\sqrt{3} \in S$

$$1) (a_1 + b_1\sqrt{3}) - (a_2 + b_2\sqrt{3}) = (a_1 - a_2) + (b_1 - b_2)\sqrt{3} \in S$$

$$2) (a_1 + b_1\sqrt{3}) \cdot (a_2 + b_2\sqrt{3}) = a_1a_2 + a_1b_2\sqrt{3} + b_1\sqrt{3}a_2 + 3b_1b_2$$

$\therefore S$ is a subring of $(\mathbb{R}, +, \cdot)$.

Q2/ $(\mathbb{Z}_6, +, \cdot)$ is a ring , and subring of $(\mathbb{Z}_6, +, \cdot)$ are :

$$S_1 = \{0\}$$

$$S_2 = \{\mathbb{Z}_6\}$$

$$S_3 = \{0, 2, 4\}$$

$$S_4 = \{0, 3\}$$

Remark: Let R be a ring and S be a subring of R .

- 1) If R is a comm. then S is a comm.
- 2) If S is comm. then is not necessary that R is comm.
- 3) If R has identity, then it is not necessary that S has identity.
- 4) It may be that R , S have the same identity.
- 5) It may be that R , S have distinct identity.
